

BusinessPilot AI Compliance Infrastructure

Invoicing, VAT compliance and an AI finance copilot — delivered as a layer your platform integrates once and never rebuilds.

9

COMPLIANCE PROFILES

6

GCC JURISDICTIONS

1

INTEGRATION

\$/inv

USAGE-BASED

Compliance is a moving target.

Every Gulf tax authority ships its own mandate, schema and timeline. Building and maintaining that in-house costs engineering quarters — repeatedly, per country.

01

Canonical model

One neutral invoice document. Jurisdiction rules live in swappable compliance profiles, never in your code.

02

Nine profiles

Gulf VAT, Saudi ZATCA Phase 2, Bahrain, Oman, Qatar, Kuwait, Peppol BIS 3.0, Singapore InvoiceNow, generic JSON.

03

Client-ready output

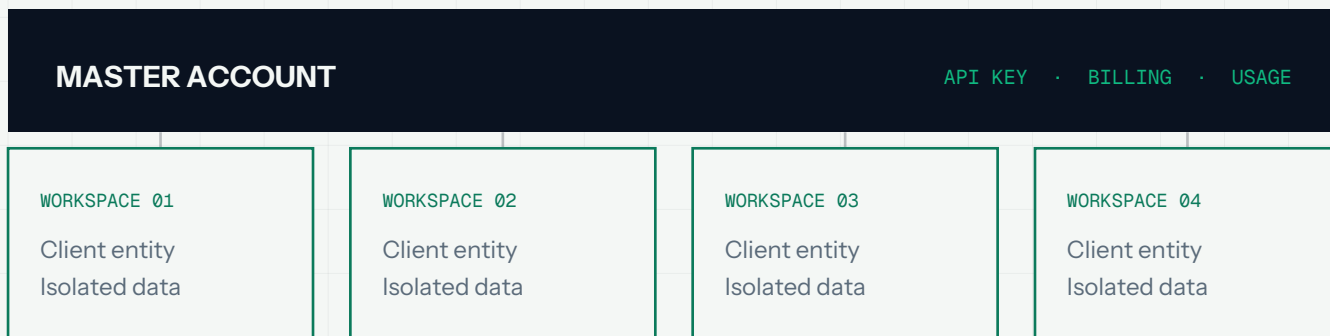

UBL 2.1 / JSON for the authority, plus approved A4 PDF and editable Word copies for the customer.

One layer, five capabilities.

- | | |
|----------------------------|--|
| ■ Invoicing | Line-level VAT, sequential numbering, discounts, full status workflow. |
| ■ Compliance export | Profile-driven UBL / JSON generated from live workspace data. |
| ■ Internal approval | Client-facing documents release only after a recorded approval. |
| ■ Contract analysis | AI extraction of value, terms, obligations, risks and VAT notes. |
| ■ Finance copilot | Plain-language questions answered from live receivables data. |

Your clients. Our engine.

ERPs, accounting firms and corporate service providers run a master account above unlimited client workspaces — isolated data, role-based access, one API key.

Pay per exported invoice.

METERING	Every compliance export writes a usage event, priced per partner.
ACCRUAL	Period subtotals update in real time — no month-end reconciliation.
SETTLEMENT	Periods close and charge automatically on a scheduled run.
VISIBILITY	Partner console shows clients, keys, usage and billing history.

Integrate once. Never build compliance again.

Request a partner workspace, sandbox API key and a walkthrough of the export, approval and billing flow.
